Canada 

# Context

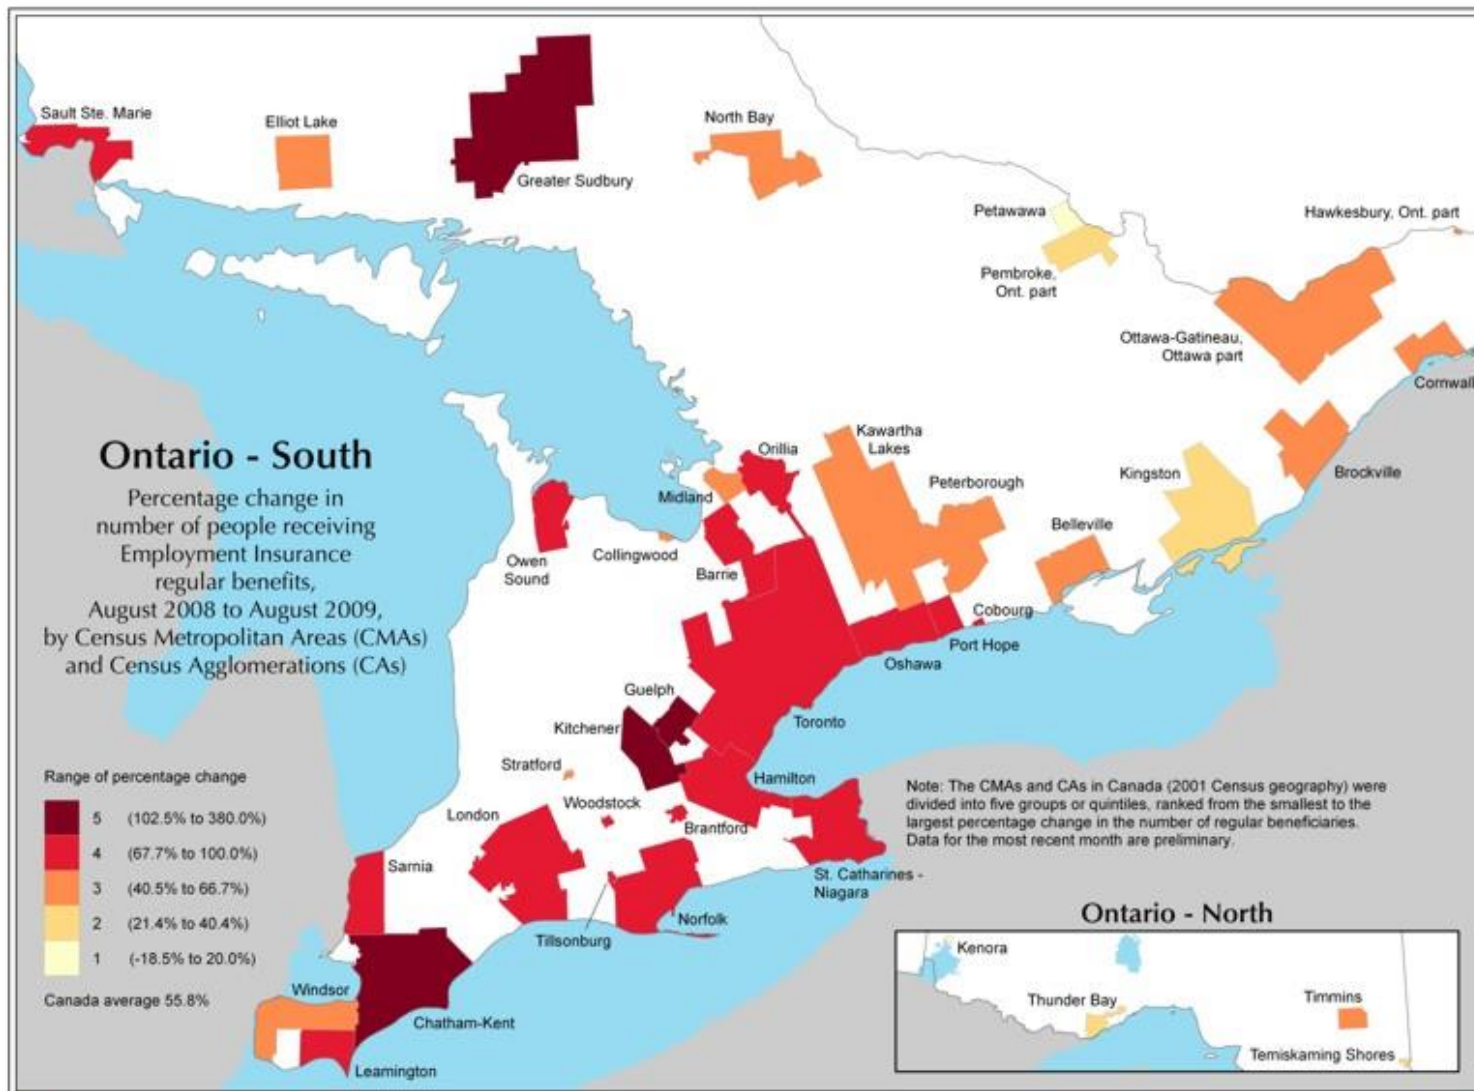

- The self-contained labour areas (SLA) came from the desire to explore new ways to deal with local data, particularly for non-urban areas.
- In 2011, 19% of Canadian residents lived outside of the Census Metropolitan Areas (CMAs) and Census Agglomerations (CAs)  
These areas are often:
  - Less clearly delineated than urban areas, due to administrative differences between regions
  - Less accessible for analysis, as populations are often small for survey or sample statistics to be created or tracked reliably

# Experiences in other countries

- “Commuting zones (CZ's) and labor market areas (LMA's) were developed because **county boundaries are not adequate confines for an area's economy**. A local economy and its labor market are bounded not by the nearest county line, but by interrelationships between buyers and sellers of labor. If we are to understand the diversity of nonmetro America we need a geographic standard capturing variations in local economic and labor force activities. The central objective of CZ's and LMA's was to develop such a geographic unit that better captures the economic and social diversity of nonmetro areas.”

# An example

# Sub-provincial geographies, example

- Economic regions and census divisions

# Project background

- Analysis with 2006 census data. Published in “Self-contained labour areas: A proposed delineation and classification by degree of rurality”. Available online at: <http://www.statcan.gc.ca/pub/21-006-x/21-006-x2008008-eng.pdf>
- Update analysis with 2011 Census/NHS data.
- Currently: cost-recovery project in collaboration with the Statistical Registers and Geography Division (SRGD), and funded by ESDC. Objective: to refine the 2011 SLA delineation, and move it toward a new geographical classification

# Definitions

## Self-Contained Labour Area (SLA):

- A group of Census Subdivisions (CSDs) that meets or exceeds a threshold of labour self-containment
- Self-containment for any SLA will never be less than 75%

Self-containment has two parts:

- **Self-containment of Area Workers:**
  - % of area jobs that are filled by area residents
  - (How many of the available jobs are filled by local residents?)
- **Self-containment of Area Residents:**
  - % of area residents that have jobs in the area
  - (How many of the local residents stay in the area to work?)

# Methodology

## Methodology Summary:

- Custom clustering process that grouped areas together based on the reciprocal strength of the commuting ties between them

## Features:

- Minimizes urban bias
- Uses a sliding scale that requires higher self-containment for smaller areas
  - From a maximum of 90% for areas under 1,000 workers
  - To a minimum of 75% for areas above 25,000 workers

# Methodology: commuting strength

- Equation adapted from OECD studies and that used to define Travel-to-Work Areas for the UK:

$$S_{a,b} = \frac{(F_{a,b})}{R_a} * \frac{(F_{a,b})}{W_b} + \frac{(F_{b,a})}{R_b} * \frac{(F_{b,a})}{W_a}$$

- $F_{a,b}$  is the number of journeys to work from area A to area B
- $R_a$  is the number of workers who live in area A
- $W_a$  is the number of workers who work in area A
- $R_b$  is the number of workers people who live in area B
- $W_b$  is the number of workers who work in area B

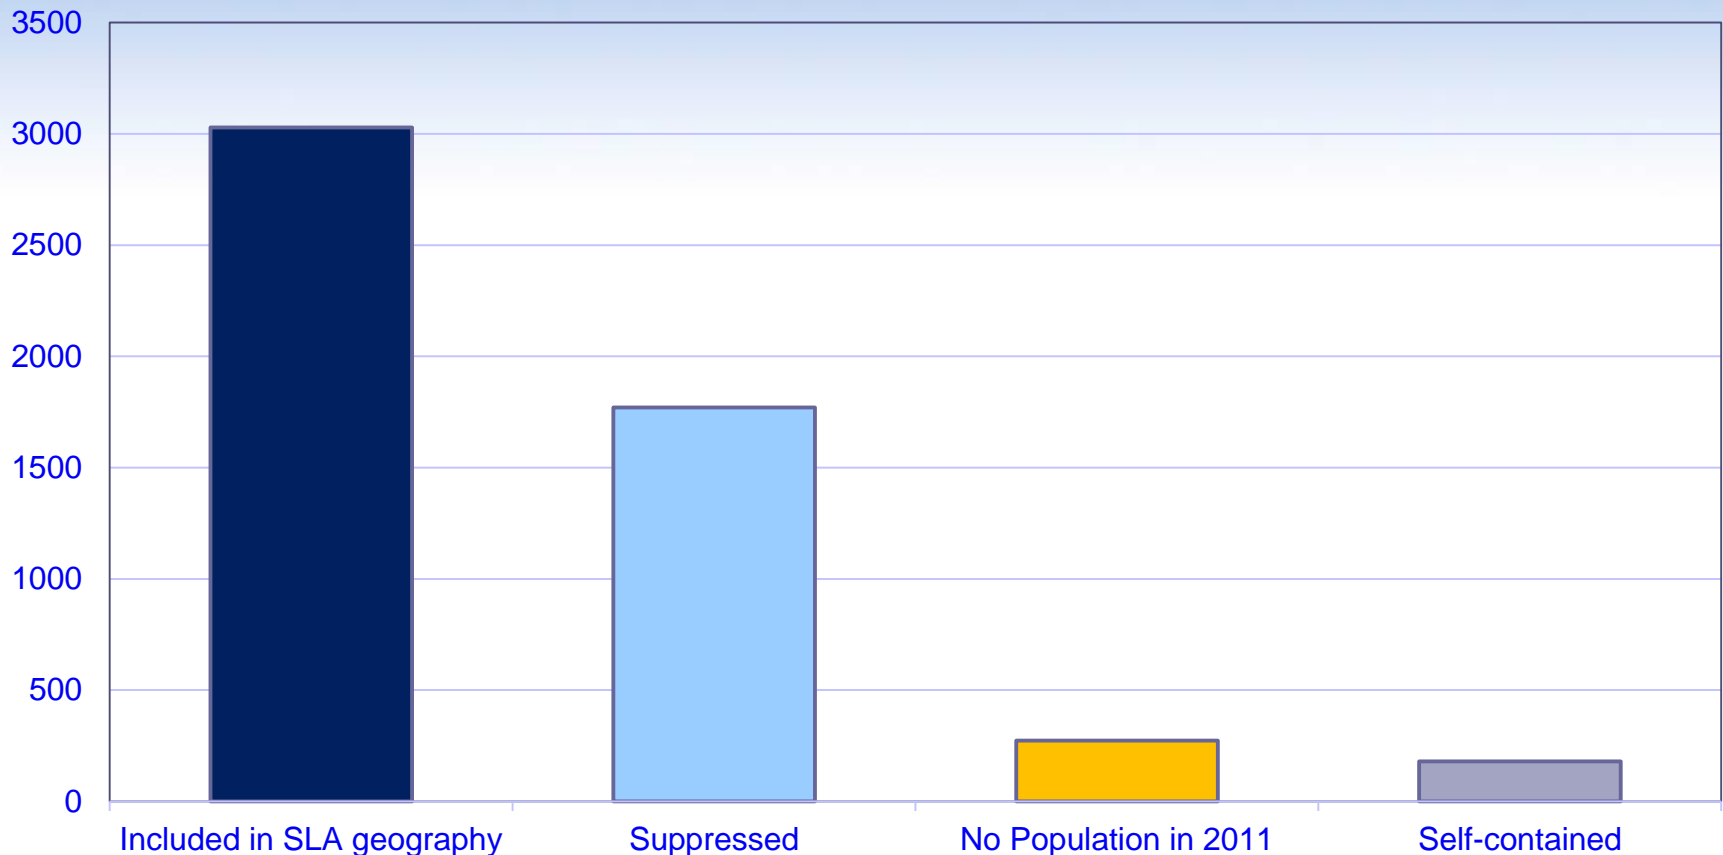

# Results from clustering algorithm

- Using 2011 Census/NHS data, there were 329 self-contained labour areas resulting from the clustering algorithm
- The average self-contained labour area:
  - Was 96% self-contained
  - Had a resident workforce of 36,000
  - Had a resident population of 89,000
  - Contained 11 CSDs
  - Was geographically contiguous
- Some CSDs were not grouped because they were completely self-contained or had suppressed data

# SLA geography exclusions, 2011

Number of CSDs

Total Number of CSDs = 5253

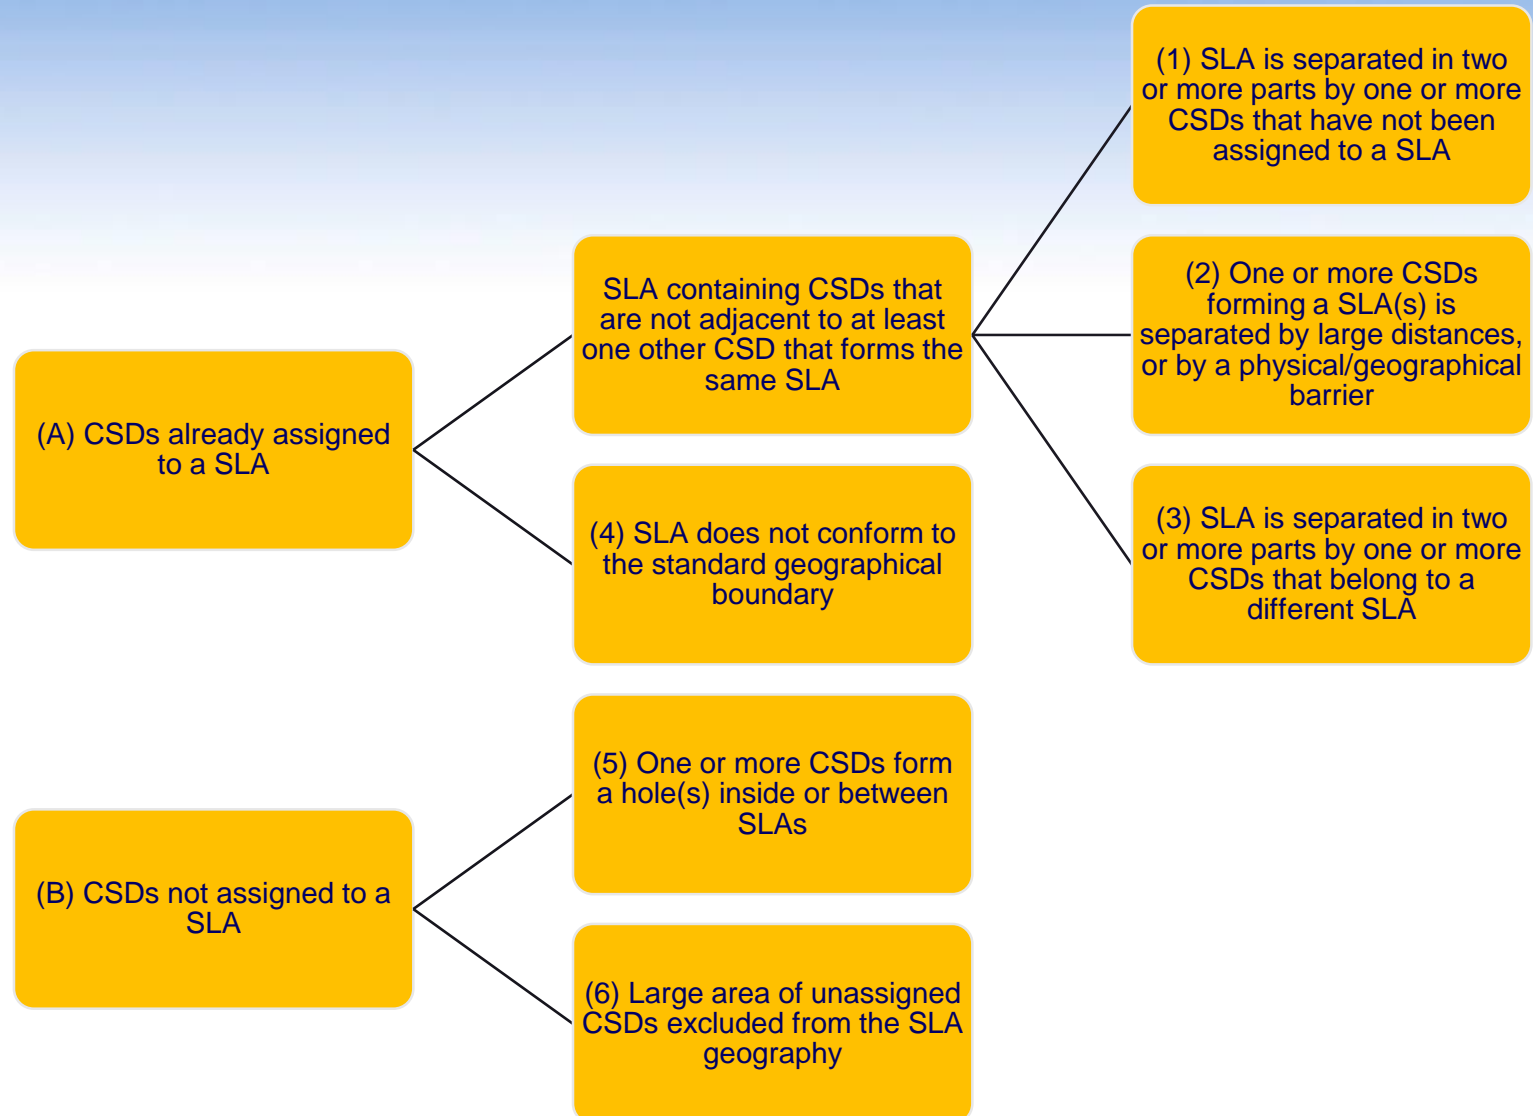

■ Included in SLA geography   ■ Suppressed   ■ No Population in 2011   ■ Self-contained

# Two key considerations in enhancing the clustering results

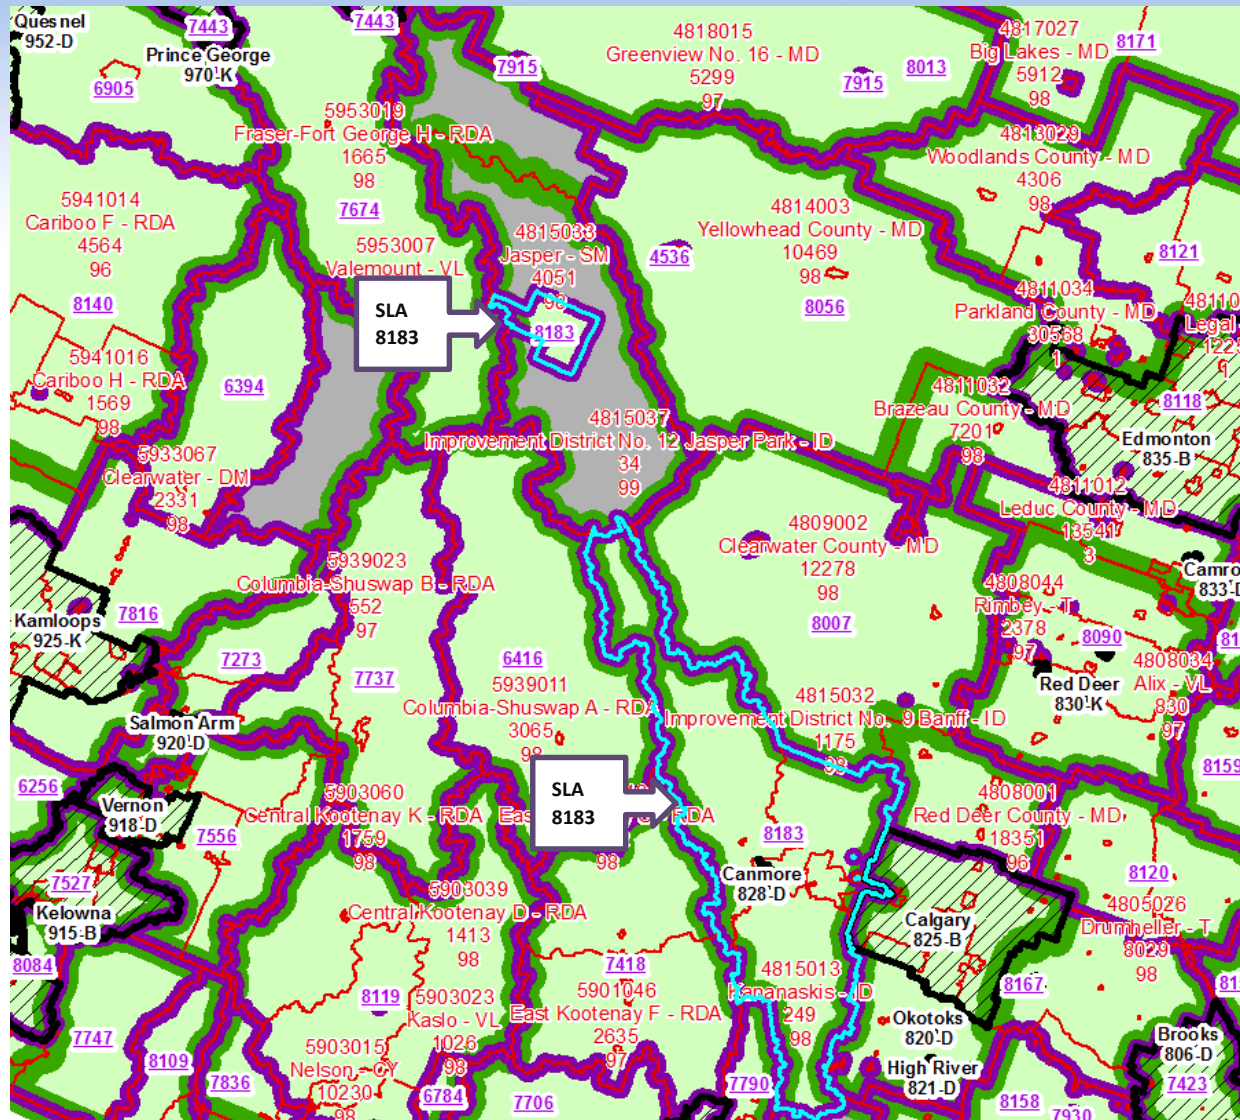

- Preserving geographic contiguity versus ensuring minimal impact on the population
  - If too many people are affected by the SLA boundary realignment, then the concept of a “SLA” may not hold true any longer
- Respecting the unique characteristic of a particular labour market versus ensuring an efficient rule to delineate the SLA boundaries
  - If we fail to check the underlying reason that cause a SLA to form in certain way, then realigning the SLA boundary may affect the labour market reality of that particular SLA.

# Geographic contiguity

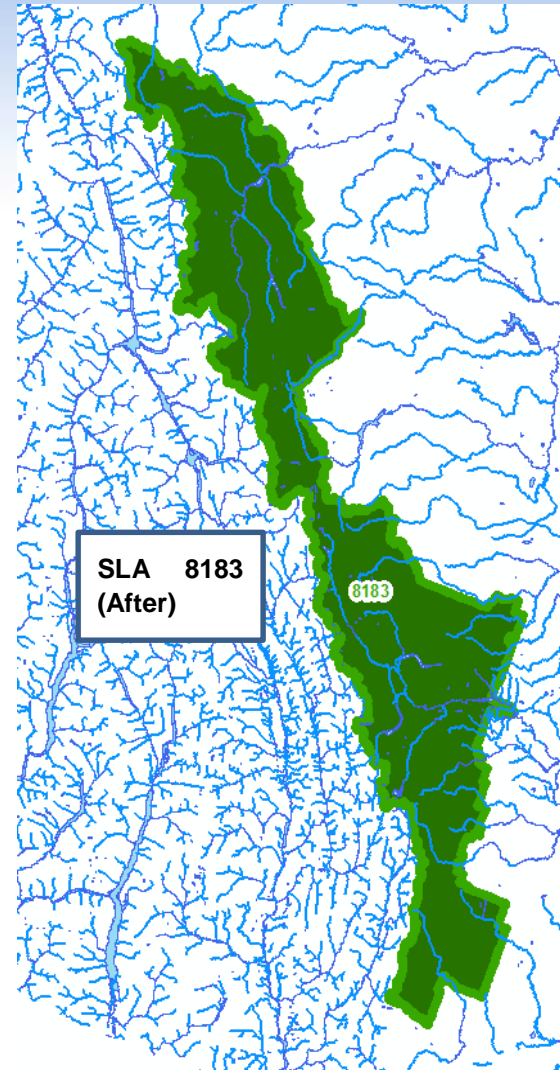

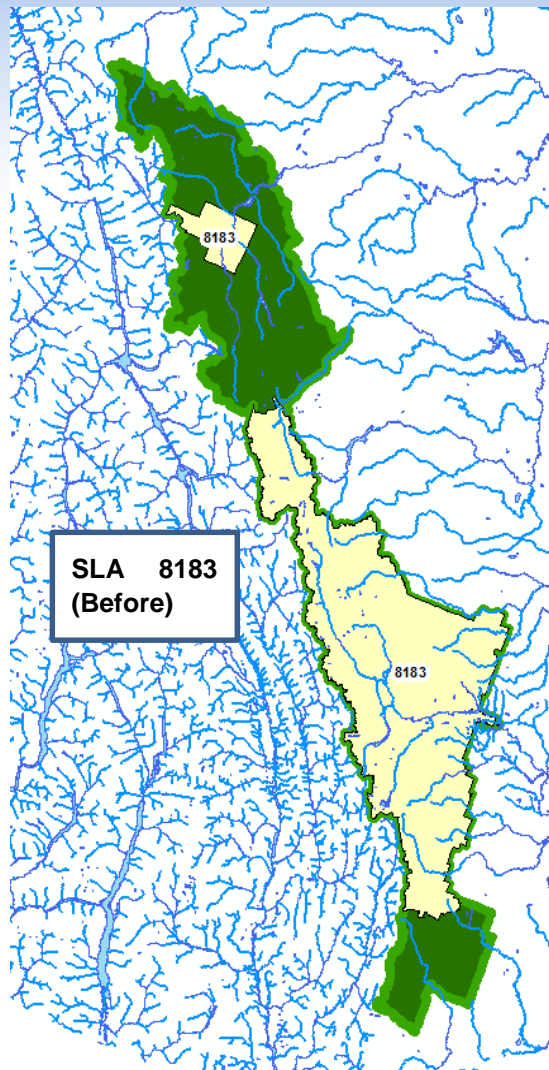

# Contiguity case example

One or more isolated SLA is surrounded by unassigned CSDs

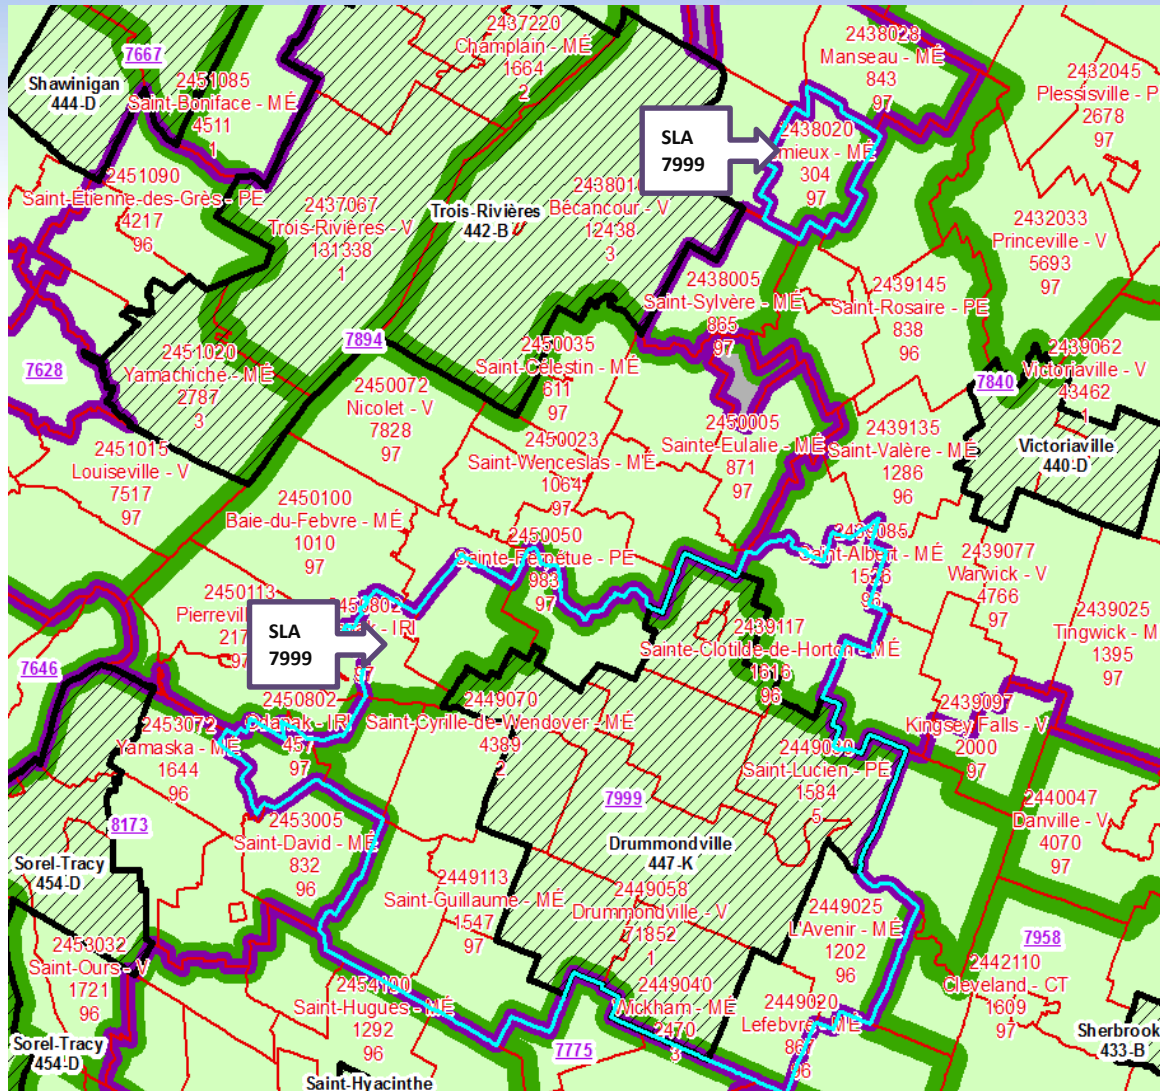

# Contiguity case resolved

One or more isolated SLA is surrounded by unassigned CSDs

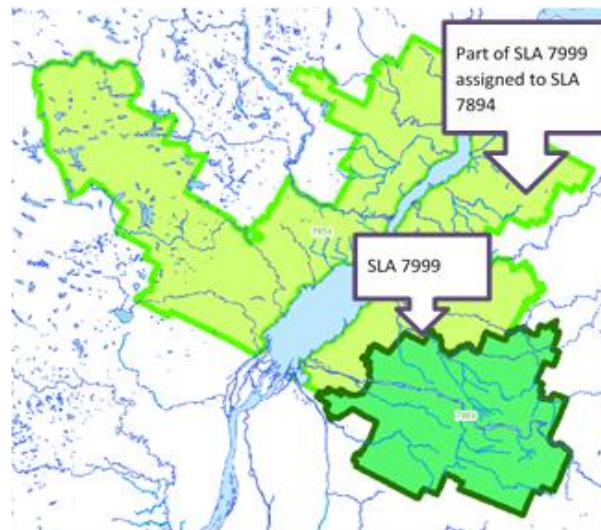

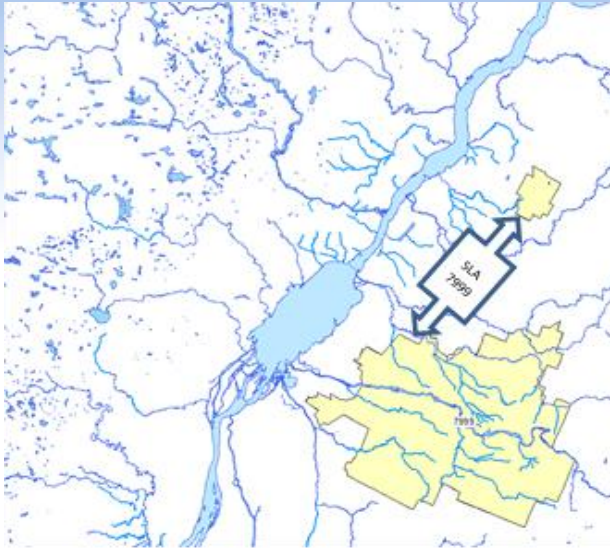

# Contiguity case example

Part of a SLA is separated and is surrounded by other SLAs

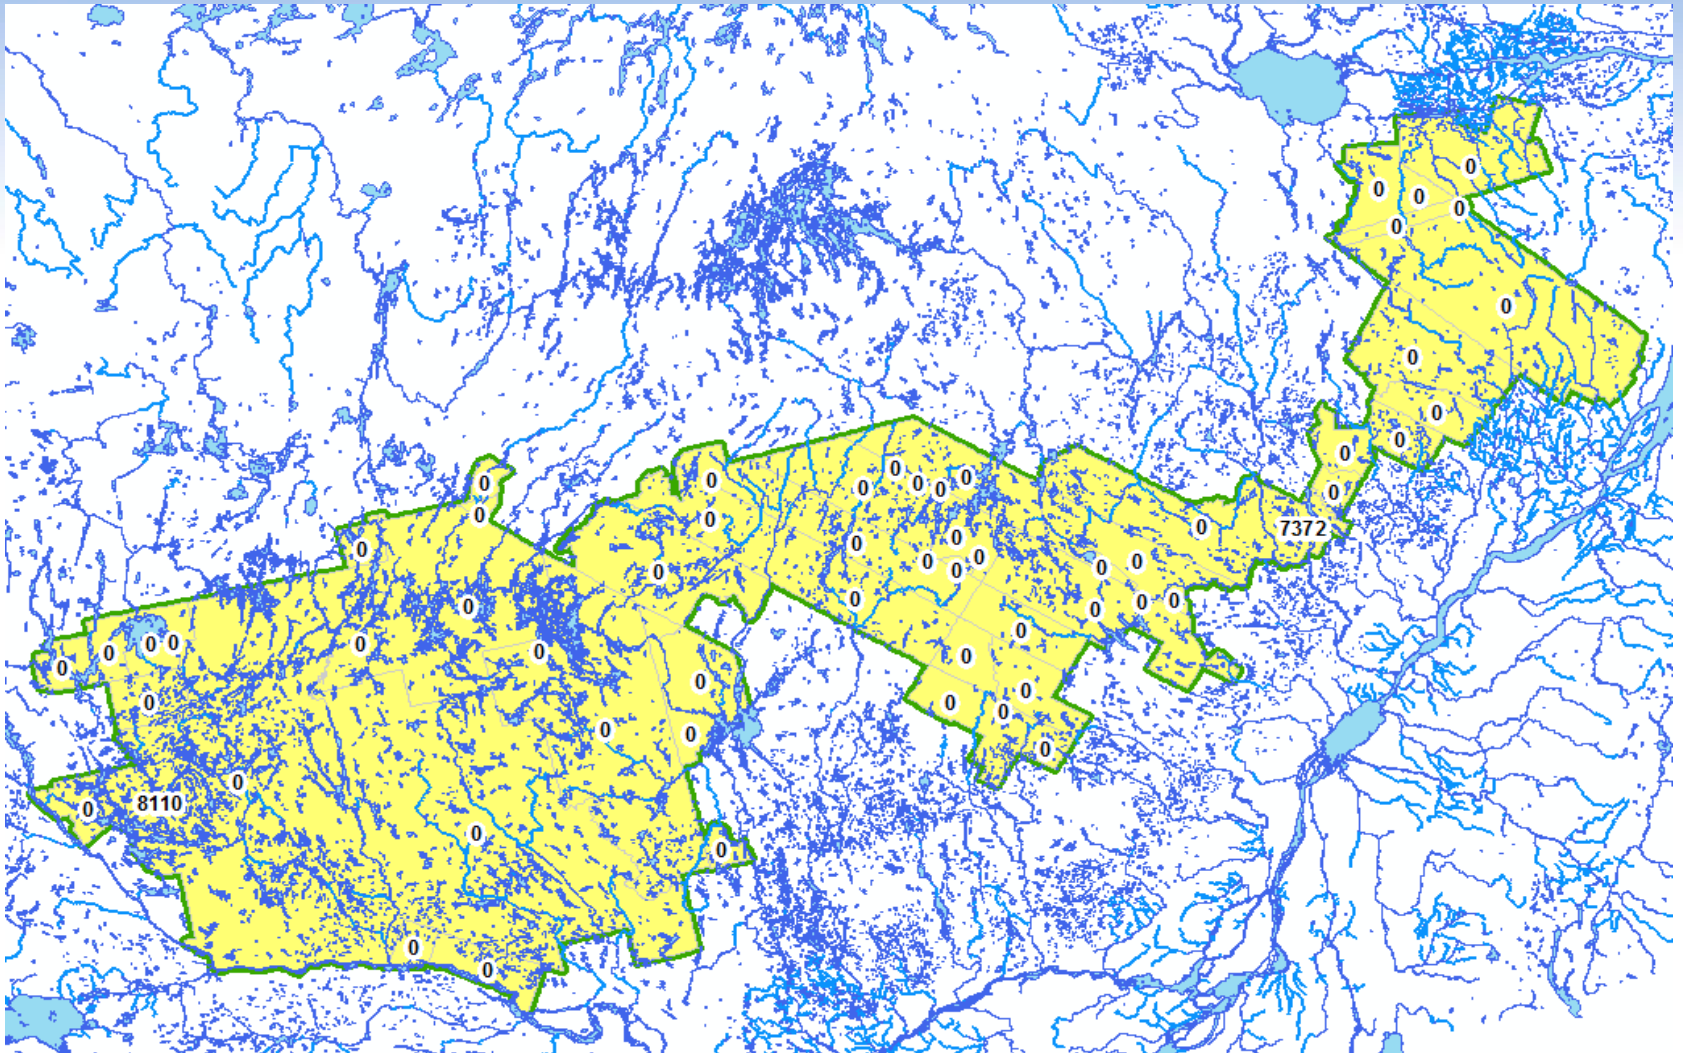

# Contiguity case resolved

Part of a SLA is separated and is surrounded by other SLAs

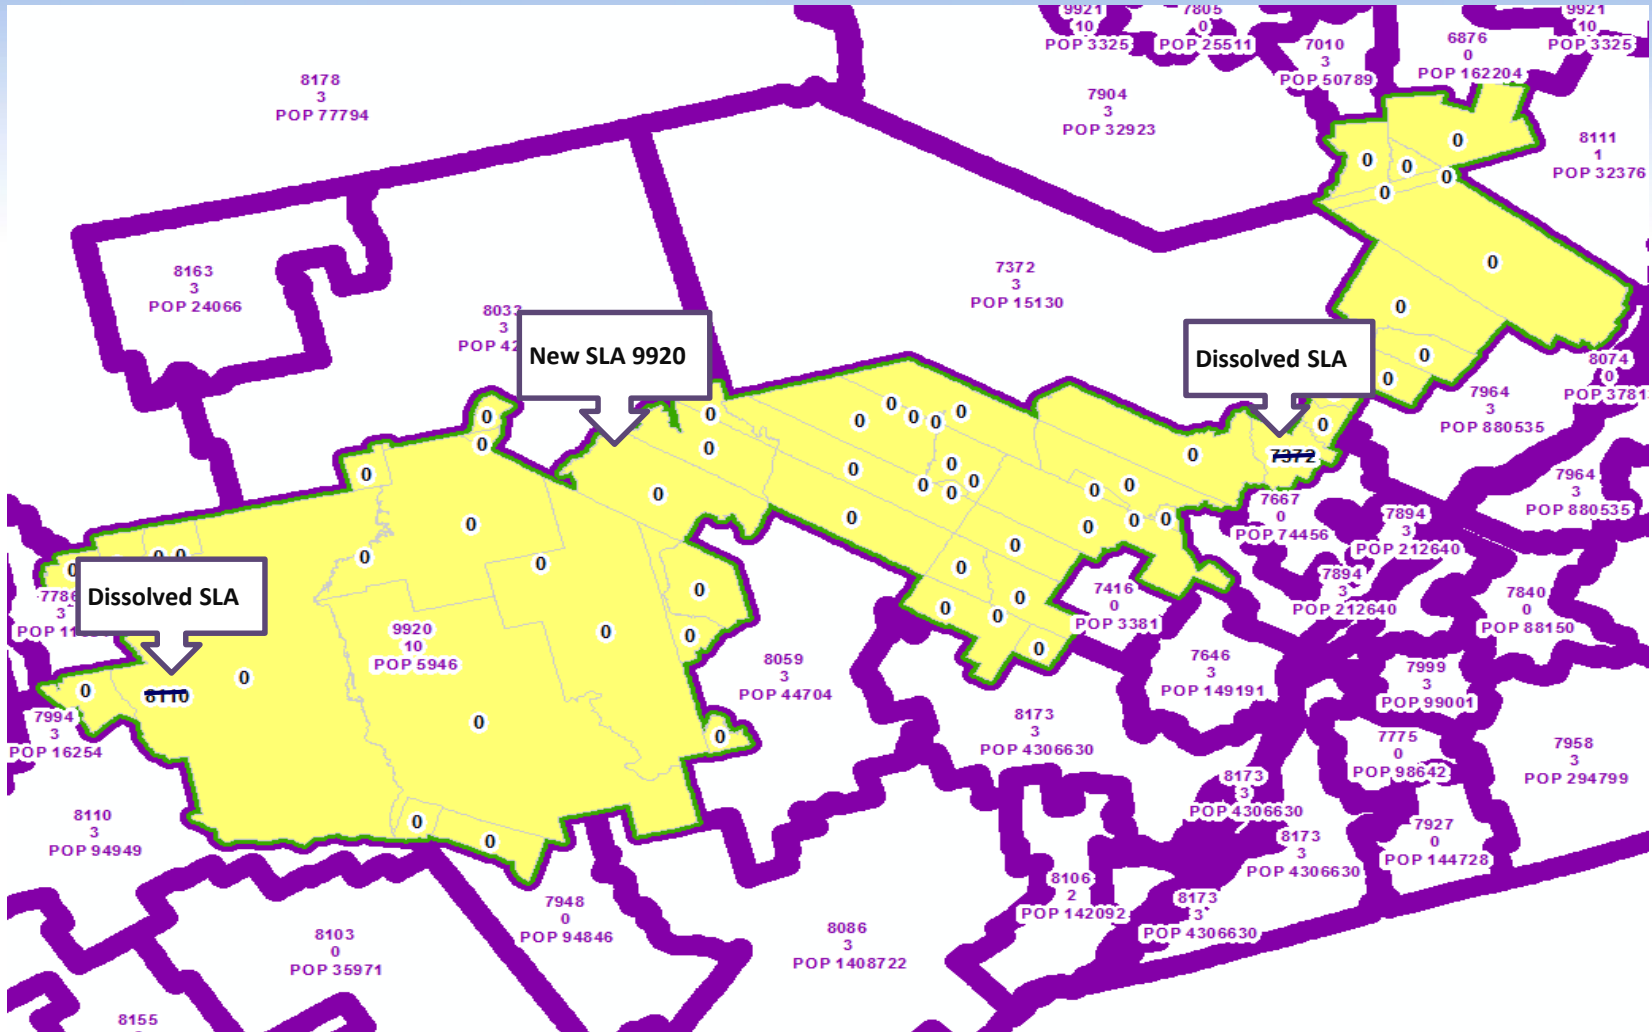

# Contiguity case example

A large area excluded from the SLA geography (CSDs coded as “0”)

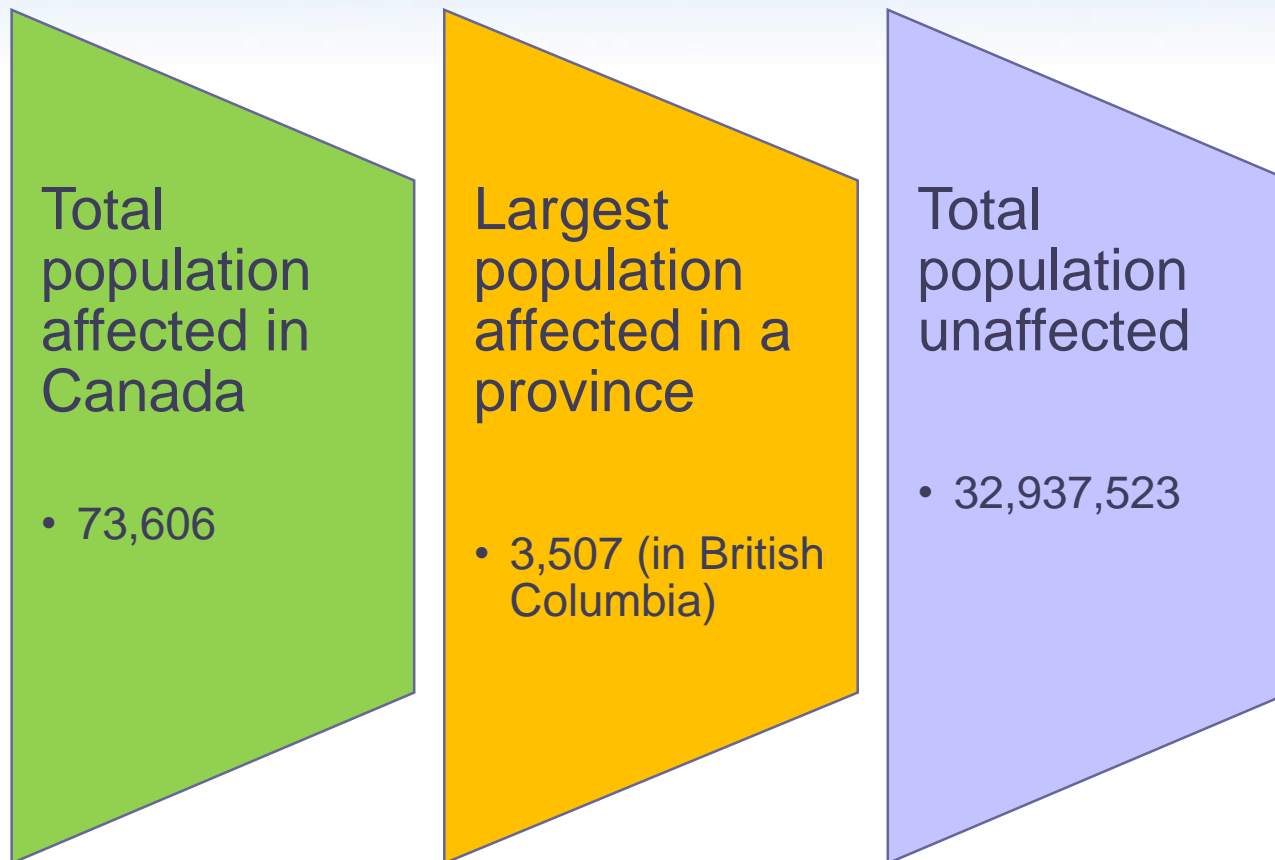

A large area excluded from the SLA geography (CSDs coded as “0”)

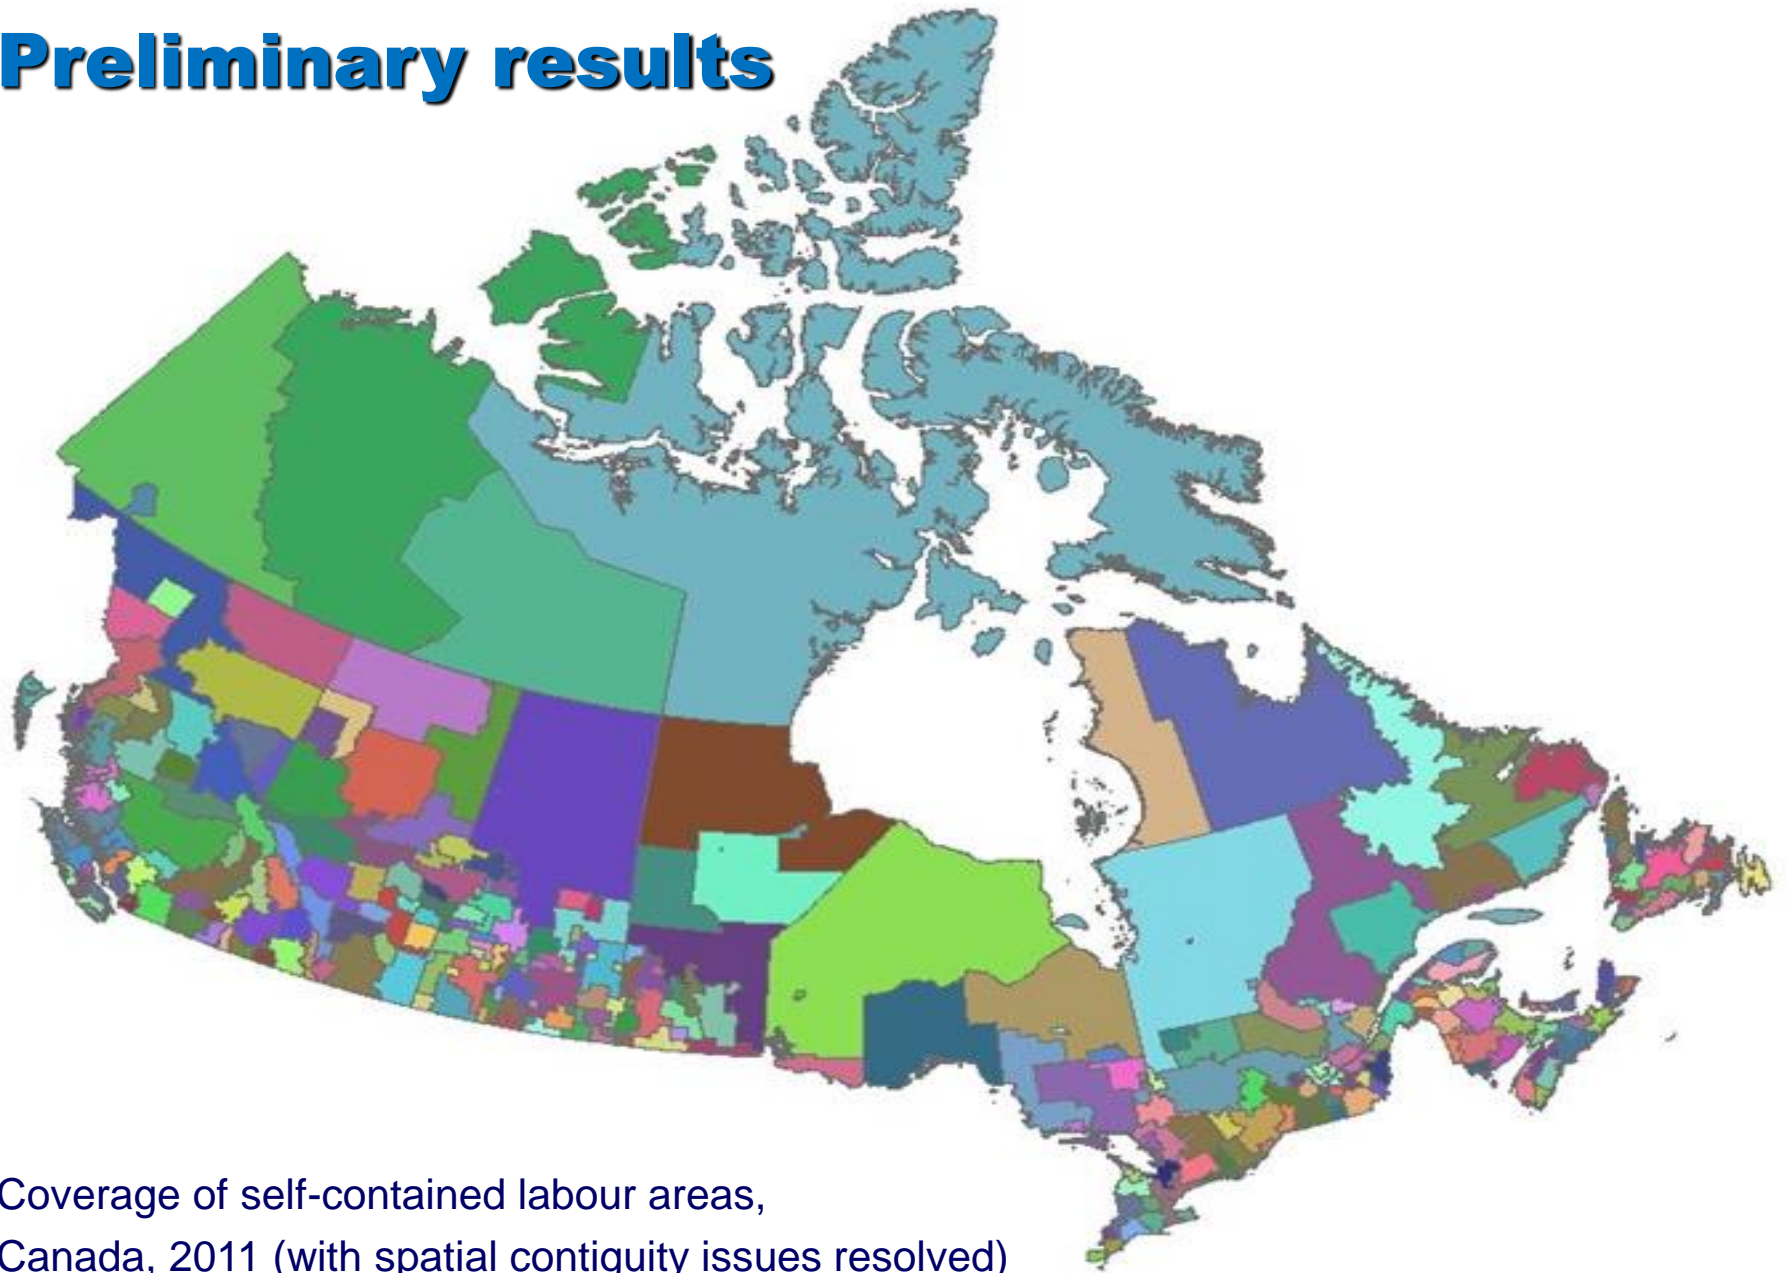

# Results of reclassification

- The latest iteration to resolve the contiguity issue in the SLA geography has had little impact on the population

# Preliminary results

# Preliminary results

	Number of SLAs		SLA Population 2011	
	Count	%	Count	%
Newfoundland and Labrador	36	10%	514,536	2%
Prince Edward Island	4	1%	140,204	<1%
Nova Scotia	11	3%	921,727	3%
New Brunswick	14	4%	751,171	2%
Quebec	61	17%	7,903,001	24%
Ontario	40	11%	12,851,821	38%
Manitoba	24	7%	1,208,268	4%
Saskatchewan	67	19%	1,033,381	3%
Alberta	31	9%	3,645,257	11%
British Columbia	55	16%	4,400,057	13%
Yukon	2	1%	33,897	<1%
Northwest Territories	3	1%	41,462	<1%
Nunavut	1	<1%	31,906	<1%
<b>Total SLAs in all provinces</b>	<b>349</b>	<b>100%</b>	<b>33,476,688</b>	<b>100%</b>
SLAs that span provincial boundaries	13		2,021,529	
<b>Total number of unique SLAs</b>	<b>336</b>			

# Summary

- Currently: 336 unique self-contained labour areas, which maximize self-containment and provide increased delineation for geographies outside of CMA/CA areas:
  - 204 SLAs achieved self-containment status without any CSDs within a CMA/CA.
  - 108 SLAs contain some CSDs in a CMA/CA and some that fall outside of a CMA/CA
  - 24 SLAs are entirely self-contained within a CMA/CA boundary
  
- SLA geography was run using both 2006 and 2011 data; the geographies produced were largely coherent between the two time frames

# Future improvements

- Merging adjacent SLAs (previously established SLAs)
  - Economic characteristics (industry composition)
  - Connectivity with road network file
- Users feedback/consultations

# **Questions/Comments**
